

# KI2586 Alnova

## The early Pinova

Alnova apples mature earlier than the classic Pinova. They turn a better colour and ripens extremely rapidly, which means the trees can be picked clean with fewer harvesting passes. Alnova apples have an excellent storage life and a good shelf life. They are not subject to any club licensing requirements and can be marketed freely.

### Tree

Alnova grows more compactly than Pinova, and the trees have a drooping growth pattern. As they can be planted more closely together, they achieve the same yields per hectare as Pinova.

### Harvest

2-3 weeks before Pinova, immediately after Gala, two pickings in 1-2 weeks

## Our Tree - Your Success

The Gruber Genetti Nursery has been the epitome of **supremely high quality** apple tree propagation **since 1991**.

Our production site in Roverchiara, Verona/Italy comprises **more than 200 ha**, providing us with a yearly production of **about 2 million apple trees**. Thanks to our many years' experience, our competent staff and state-of-the-art technology, you will receive **high quality saplings** from current varieties and clones.

In addition to comprehensive advice, our service includes **prompt processing** of your order as well as **punctual delivery**.
